GUI/Screenshots of Interface

DBMS: MySQL

Languages: PHP, HTML, CSS, JavaScript

Create University

The screenshot shows a web application titled "Create University". At the top, there is a Google Map of Orlando, FL, with a red pin marking the location of the University of Central Florida. Below the map, there are several input fields for university details:

- Latitude: 28.6024274
- Longitude: -81.2000599
- Address: 4000 Central Florida Blvd, Orlando, FL 32816, USA
- Website: UCF. Go Knights!
- Phone: 68442
- Image URL: (empty)
- Email Domain (e.g., ucf.edu): (empty)

At the bottom of the form, there is a button labeled "Create University".

University Directory

University Directory

University of Central FL
Orlando – 68,442 students

Uf, Gainesville, FL, USA
605 Woodlawn Dr, Gainesville, FL 32603, USA – 61,771 students

Florida State University, South Copeland Street, Tallahassee, FL, USA
171 N Woodward Ave, Tallahassee, FL 32304, USA – 44,597 students

Florida Gulf Coast University, FGCU Boulevard, Fort Myers, FL, USA
9900 FGCU South Court, Fort Myers, FL 33913, USA – 16,230 students

ER-Model

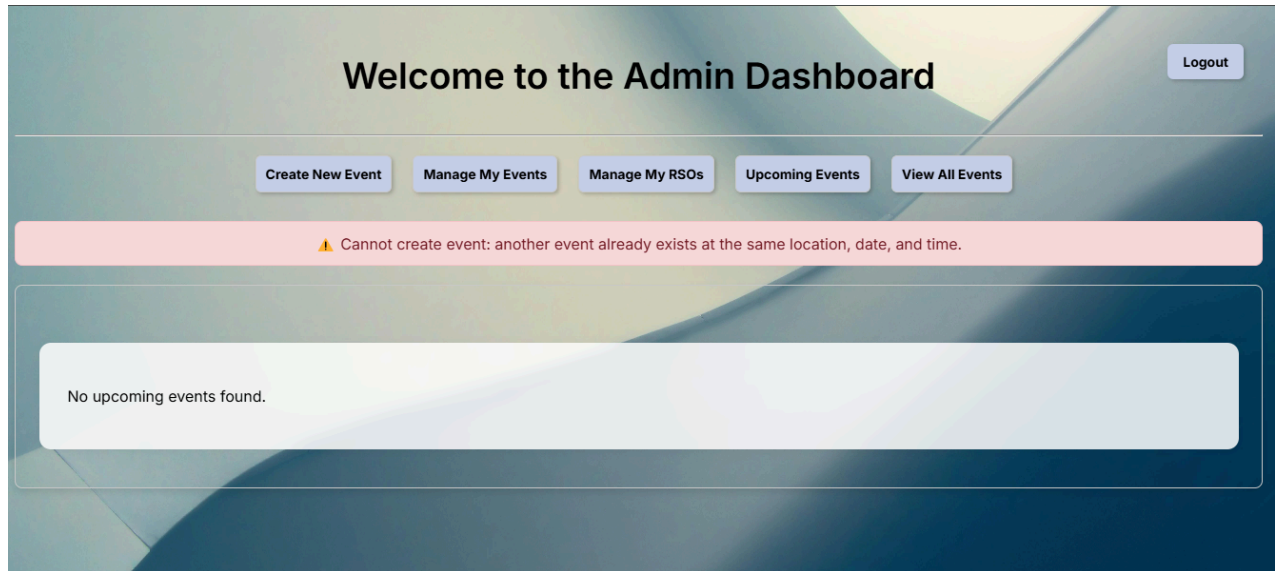

University Event Management System

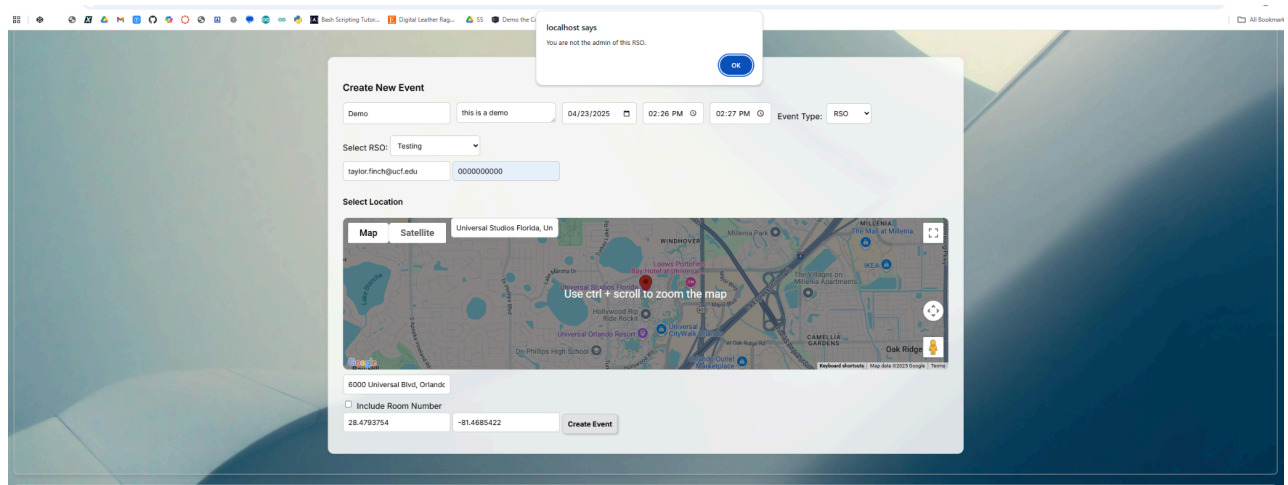

Constraints

Show SCREENSHOTS of error messages/warnings when the following events/attempts are made:

- A new event to be held at the same location and overlapping times with an existing event. Show error message with enough detail such as the conflicting events, time, location, etc.:

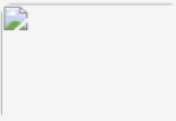

- An admin who is not the Admin of the RSO attempts to create an event for that RSO. Show an error message:

- An INSERT of a member of an RSO with 4 members: Show the status of the RSO changed to 'Active.' A DELETE of a member of an RSO with 5 members. Show the status of the RSO changing to 'Inactive':

Active

```
mysql> SHOW CREATE TABLE Events;
```

```
+-----+-----+
| Table | Create Table
```

```
|
```

```
+-----+-----+
| Events | CREATE TABLE `Events` (
  `Event_ID` int NOT NULL AUTO_INCREMENT,
  `Event_Name` varchar(255) NOT NULL,
  `Description` text,
  `Lname` varchar(255) NOT NULL,
  `Event_Date` date DEFAULT '2024-01-01',
  `Start_Time` time DEFAULT '00:00:00',
  `End_Time` time DEFAULT '01:00:00',
  PRIMARY KEY (`Event_ID`),
  UNIQUE KEY `no_event_overlap` (`Event_Date`,`Start_Time`,`End_Time`,`Lname`),
  KEY `Events_ibfk_1` (`Lname`),
  CONSTRAINT `Events_ibfk_1` FOREIGN KEY (`Lname`) REFERENCES `Location` (`lname`)
) ENGINE=InnoDB AUTO_INCREMENT=17 DEFAULT CHARSET=utf8mb4
COLLATE=utf8mb4_0900_ai_ci |
```

```
+-----+-----+
1 row in set (0.01 sec)
```

3NF Decomposition

Move University to a Separate Table:

```
CREATE TABLE Universities (
  UniversityID INT PRIMARY KEY AUTO_INCREMENT,
  Name VARCHAR(255) NOT NULL,
  Location VARCHAR(255) NOT NULL,
  Description TEXT,
  NumStudents INT,
  Pictures TEXT, -- Could store URLs or image file names
  EmailDomain VARCHAR(255) UNIQUE NOT NULL -- e.g., 'ucf.edu'
);
```

MySQL returned an empty result set (i.e. zero rows). (Query took 0.1264 seconds.)

Modify Users Table:

```
ALTER TABLE Users
```

```
ADD UniversityID INT NULL;
```

```
ALTER TABLE Users
```

```
ADD CONSTRAINT fk_users_university
```

```
FOREIGN KEY (UniversityID)
REFERENCES Universities(UniversityID)
ON DELETE SET NULL
ON UPDATE CASCADE;
```

MySQL returned an empty result set (i.e. zero rows). (Query took 0.2922 seconds.)

Having a 3NF for our college events website project allows us to avoid data redundancy (no repeated university names in multiple rows), maintain data integrity (any change in university details happens in one table), and improve performance (less storage, faster queries for university-related data)

Relational Data Model/Database Creation Code

Populating tables with sample data: for example: two universities, 20 students, 3 RSOs, five events, three comments, etc. IMPORTANT: integrity of data must be maintained, i.e., all constraints must be enforced, including no overlapping events, active RSO must have at least five members

- CREATE DATABASE COP4710;
- CREATE USER 'username'@'local_ip' IDENTIFIED BY 'password';
- GRANT ALL PRIVILEGES ON COP4710.* TO 'username'@'local_ip';
- FLUSH PRIVILEGES;
- USE COP4710;

-- Users Table

```
CREATE TABLE Users (
    UID INT PRIMARY KEY AUTO_INCREMENT,
    Name VARCHAR(255) NOT NULL,
    Email VARCHAR(255) UNIQUE NOT NULL,
    UserType ENUM('Student', 'Admin', 'SuperAdmin') NOT NULL,
    Password VARCHAR(255) NOT NULL
);
```

```

CREATE TABLE Location (

    lname VARCHAR(255) PRIMARY KEY, -- Location name as the unique identifier

    address VARCHAR(500) NOT NULL, -- Physical address

    latitude DECIMAL(9,6) NOT NULL, -- Google Maps latitude

    longitude DECIMAL(9,6) NOT NULL -- Google Maps longitude

);

```

-- Events Table (Superclass for ISA Hierarchy)

```

CREATE TABLE Events (

    Event_ID INT PRIMARY KEY AUTO_INCREMENT,

    Event_Name VARCHAR(255) NOT NULL,

    Description TEXT,

    Time DATETIME NOT NULL,

    Lname VARCHAR(255) NOT NULL,

    FOREIGN KEY (lname) REFERENCES Location(lname),

    UNIQUE (Time, lname),

);

```

-- RSO Table

```

CREATE TABLE RSOs (

    RSO_ID INT PRIMARY KEY AUTO_INCREMENT,

    RSO_Name VARCHAR(255) UNIQUE NOT NULL

    Admin_ID INT NOT NULL

    Description TEXT

    Status ENUM('Active', 'Inactive') DEFAULT 'Inactive';

);

```

-- RSO_Events (ISA: Subclass of Events)

```
CREATE TABLE RSO_Events (  
    Event_ID INT PRIMARY KEY,  
    RSO_ID INT NOT NULL,  
    FOREIGN KEY (Event_ID) REFERENCES Events(Event_ID),  
    FOREIGN KEY (RSO_ID) REFERENCES RSOs(RSO_ID)  
);
```

-- Admins Table

```

Comments/Observations

- Database performance: query response time, suggested indexes
- Desired features/functionalities: security (login), event feed from university websites (e.g., XML feeds from <http://events.ucf.edu/>), social network integration (Facebook, Twitter, etc.)
- Problems encountered, things that have been learned from the project, more things/skills needed to master to build a more advanced database app. In retrospect, what are the things you would have done differently to implement the project?

Lessons Learned

The importance of proper folder structure: We realized how critical it is to ensure that file paths and routing match the server's file system, especially when working with web servers like Apache. A misplaced folder can lead to routing issues and blank screens.

Understanding server behavior: The infamous “white screen of death” taught me that silent errors (like missing files, incorrect includes, or suppressed PHP errors) require careful debugging, error logging, and sometimes just checking the basics like file permissions and paths.

Reliable deployment practices: We learned the importance of maintaining a clean and consistent CI/CD pipeline. Moving files manually can break automation — keeping Git and deployment scripts correctly configured ensures that the server always reflects the latest working code.

Database permissions matter: When connecting to a remote MySQL database, We faced issues due to user host permissions. This reminded me that access control in MySQL is precise and that permissions must be explicitly granted to the correct IP addresses.

Advanced Features

Password hashing: we transformed our user's passwords into an unreadable string for extra privacy and protection
